

7-6 User Testing

User testing is performed on a Syrian Private University pilot environment using SpuCampusDemoSeeder data (28 students, 10 supervisors, 28 projects, 4 committees).

1) User Sample and Roles

Role	Demo Account	Test Scenario
University Admin	spu-campus-admin@syrian-private.local	XML import, tracks, committees, schedule generate & approve
Supervisor	spu-campus-supervisor-01@syrian-private.local	Review proposals, availability, follow projects
Student	spu-campus-student-01@syrian-private.local	Submit proposal, track progress, tasks, notifications

Shared demo password: password

2) Survey / Interview Themes

- Ease of registration and match with official university records.
- Clarity of the proposal flow until project creation.
- Clarity of the academic track (locked / open stages).
- Usefulness of AI ideation and task generation.
- Clarity of scheduling results for committees and admin.
- Suggested improvements.

3) Initial Findings from Internal Pilots

Observation	Impact	Improvement
Early track assignment on proposal submit caused premature locking	Confusion in stage UI	Defer track assignment until approval (fixed)
Multi-university supervisors might miss proposals for membership universities	Delayed review	Extend TenantScope to supervisor memberships (fixed)
Need for ready demo data	Slower demos	SpuCampusDemoSeeder

4) Conclusion

User testing on the campus demo showed that primary flows are usable by all three roles, and critical issues related to data isolation and track locking were addressed before final delivery. Detailed survey results (if collected) are attached in the appendix for formal submission.
